

DTI Case Study

Industrial Automation Platform for Sawmills

DTI is currently working with the North American leader in the design and manufacturing of sawmill technology and equipment for the lumber industry by providing a custom wallmount system powered by an Intel® Pentium® III processor based single board computer. The system was designed to operate in harsh, dusty environments associated with saw mills. DTI's ruggedized system is used with innovative technology to provide optimal log recovery through continuous scanning, skewing and slewing of the lumber allowing for the shortest integration in the industry.
