

Flight Simulation Training Programs

The world's largest provider of aviation training services selected DTI's PCI based 2U platform, the **TrexSys-2**, to be used as the primary system running instructor programs in over 200 advanced simulators worldwide. The **LBC9216** single board computer, which is based on the Intel® Pentium® 4 processor, provides the high performance and maximum speeds the platform requires. Three of the Trexsys-2 systems are included on board each flight simulator and extends high quality and reliability to withstand the rigorous, motion-based applications used by the simulators that are on the leading edge of aircraft flight simulation.
